Many believe that a high GPA and numerous internships are the golden tickets to a software engineering job.

I'm here to disrupt that thought.

My GPA? A mere 2.72.

Internship experience? Zero.

Yet, I had three job offers before I
donned the graduation cap.

Here's my secret sauce:

Master Your Craft

Grades may get you into a school,
but they won't land you a job.

The recursive definition of a binary
tree may impress your professor, but
can you calculate the distance
between two nodes?

I invested four hours daily, honing my skills, and adding innovative elements to my course projects.

The result?

My teachers and TAs became my advocates, recommending me for jobs at top tech firms.

Chase Your Dreams Relentlessly

In my senior year, I got a call for a QA engineer internship.

I didn't take it.

It didn't align with my vision:
Engineering mind-blowing products.

But a mere lack of internship wasn't
going to stop me.

Instead, I used that summer to focus on refining my coding skills.

Months before graduation, I was acing all the coding challenges.

If you're clear on your mission, you'll carve your path.

Become Your Own Billboard

My projects weren't just for course credits.

They solved real-world problems.

I showcased them at software competitions nationwide, demonstrating my skills, passion, and ambition to potential employers.

My mantra?

"If you've got it, flaunt it."

Because a low-profile genius is still
a genius in hiding.

Look, if you're worried about your GPA or lack of internships, take a deep breath.

The internet is your playground.

- Dedicate time on Leetcode.
- Take part in online competitions.
- Seek out real-life problems in your community and start a project.

TL;DR;

In the business world,
skills beat grades, every single time.
